

Telesat LEO

RESILIENT, ASSURED
Global Communications

An aerial photograph of a US Navy aircraft carrier's deck. The deck is filled with a long line of F-35 fighter jets, parked in neat rows. The carrier is moving through the ocean, with white wake visible. The sky is clear and blue. The overall scene conveys a sense of military readiness and global reach.

TELESATTM

Telesat LEO Network

Telesat has developed a highly innovative global network composed of about 300 state-of-the-art Low Earth Orbit (LEO) satellites, seamlessly integrated with on-ground data networks

The Telesat LEO Network incorporates next-generation technology including:

Data Processing in Space: Full digital modulation, demodulation, and data routing occurs in space, resulting in higher capacity and flexibility

Phased Array Antennas: Sophisticated antennas on each satellite with hopping beams scan the earth to provide full coverage and can dynamically focus additional capacity to high-demand theaters of operation

Optical Inter-satellite Links: Data can travel at the speed of light from one satellite to another, resulting in a fully interconnected global mesh network and ability to bypass terrestrial infrastructure

Hybrid orbits: Satellites in an industry-first combination of polar and inclined orbits, resulting in complete global coverage, including polar areas, with higher capacity in high density populated areas

High Throughput

Gigabits per second speeds to a remote, and multiple Tbps of capacity in the network ensures enterprise-grade, secure connectivity for unconstrained full motion HD video dissemination, multi-spectral imagery, and command and control links.

Low Latency

The Telesat LEO Network is about 20-times more responsive than today's geosynchronous satellites and on par with fiber networks. Government users can be confident that encrypted web pages and enterprise cloud applications will work seamlessly.

Assured Access

Highly resilient, secure network with multiple interconnected satellites and multiple ground nodes without any single point of failure ensures networks always stay connected.

Global Coverage

Every point on Earth is covered, including polar regions.

High Capacity for Hot Spots

Our intelligent network can dynamically allocate bandwidth to theaters of operations with high traffic demand.

Quick Service Deployment

Compliant with Metro Ethernet Forum (MEF) standards for seamless plug and play integration.

performance at
transformative
economics

Telesat LEO Verified Performance

Telesat has conducted several testing campaigns with leading maritime, aero and enterprise service providers, demonstrating industry-leading high throughput and quality. Learn more at <https://www.telesat.com>

Telesat LEO and the DARPA Blackjack Program

DARPA (DoD's Defense Advanced Research Projects Agency) has awarded Telesat Phase 1 and Phase 2 Track B contracts under the Blackjack Program to assess the advantages of the DoD using the same spacecraft buses that Telesat will use in its LEO constellation, and having their future DoD spacecraft link to Telesat's LEO constellation via optical-based communications. The result of these investigations could lead to the DoD using Telesat's LEO system for its global broadband connectivity needs.

Telesat's LEO system is being designed with a number of capabilities that military customers are seeking including:

- High reliability and resiliency
- Global persistence
- Optical Inter-Satellite Links
- Transformative economics

Through the collaborative process underway with DARPA, additional performance, features and capabilities may be incorporated into Telesat LEO satellites to better serve the DoD's global broadband connectivity needs.
